Introduction

Over two third of earth surface is covered water less than the third is taken by land. A earth population is continuously grow people are putting ever increasing pressure on the planet's water resource. In a sense our oceans rivers and other in land water are being squeezed by human activities. Not so they take up less room but so their quality is reduced. Poor water quality means "water pollution".

We know that pollution is a human problem because it is relatively recent development in the planet history. Before the 19th Century industrial revolution people lived more in harmony with their immediate environment.

Types of Water Pollution

There are many types of water pollution because water comes from many sources. Here are a few types of water pollution.

1) Surface water pollution:-

Surface water includes natural water found on the earth's surface like rivers, lakes, and oceans. Hazardous substances coming into contact with this surface water, dissolving or mixing physically with the water can be called surface water pollution.

2) Oil spillage:-

Oil spills usually have only a localized effect on wild life but can spread for miles. The oil can cause the death to many fish and get stuck to the feathers of seabirds causing them to lose their ability to fly.

Effect of Water Pollution

The effect of water pollution are varied and depend on what chemicals are dumped and in which locations.

* Death of aquatic animals :-

The main problem caused by water pollution is that it kills organisms that depend on these water bodies. dead fish, crabs, birds and sea gulls, dolphins and many other animals often wind up on beaches, killed by pollutants in their habitat.

* Disruption of food chains :-

pollution disrupts the natural food chain as well. pollutants such as lead and cadmium are eaten by tiny animals. later, these animals are consumed by fish and shellfish and the food chain continues to be disrupted at all higher levels.

Other Causes of Water Pollution

* Sewage and waste water:-

Every day, we cook, do laundry, flush the toilet, wash our cars, shower and do many things that use water. Think about how we use water in schools, hospitals and public places.

* Underground storage and tube leakage:-

Many liquid products are stored in metal and steel tubes. Underground the sewage systems run in underground tubes. Over time, they rust and begin to leak. If that happens, they contaminate the soils and the liquid in them end up in many nearby water bodies.
